FINAL PROJECT

Questions?

- Design Document
 - Proposed Design
 - UML Diagrams describing architecture and communication
 - Work timeline with breakdown by team member

- Timeline
 - Milestone 0: Form a Team
 - Milestone 1: Select a Topic
 - Milestone 2: Literature Survey
 - Milestone 3: Design Document
 - Milestone 4: Final Presentation

LAST TIME...

- Distributed Coordination
 - Distributed Locking
 - Elections
 - State Machine Replication
 - Blockchain

THIS TIME...

- Fault Tolerance
 - Types of Failures
 - Two Generals Problem
 - Fault Tolerance Algorithms
 - Centralized FT: Raft/Paxos
 - Distributed FT: Blockchain

Next Time: Replication and Consistency Properties

DISTSYS CHALLENGES

- Heterogeneity
- Openness
- Security
- Failure Handling
- Concurrency
- Quality of Service
- Scalability
- Transparency

Any questions about these? You will need to relate your project to them and they will be on the exam!

BASIC CONCEPTS

- Being fault tolerant is strongly related to what are called dependable systems
- Dependability is a term that covers a number of useful requirements for distributed systems including the following
 - Availability
 - Reliability
 - Safety
 - Maintainability

DIFFERENT TYPES OF FAILURES

Type of failure	Description of server's behavior
Crash failure	Halts, but is working correctly until it halts
Omission failure Receive omission Send omission	Fails to respond to incoming requests Fails to receive incoming messages Fails to send messages
Timing failure	Response lies outside a specified time interval
Response failure Value failure State-transition failure	Response is incorrect The value of the response is wrong Deviates from the correct flow of control
Arbitrary failure	May produce arbitrary responses at arbitrary times

DIFFERENT TYPES OF FAILURES

What type of failure can be the most problematic one?

The failures that you can not detect it...
The system thinks that everything works well!!!

Arbitrary failure

TWO GENERALS PROBLEM

Two generals are preparing to attack a city

• They will only succeed if **both** attack simultaneously

How can they coordinate their attack?

• Any messengers sent out might get captured!

General Sun Tzu

????

"Lossy network"

General Washington

TWO GENERALS PROBLEM

Impossible to guarantee agreement in lossy network!

• So usually we will need to assume that network will eventually transmit, or loss can be detected

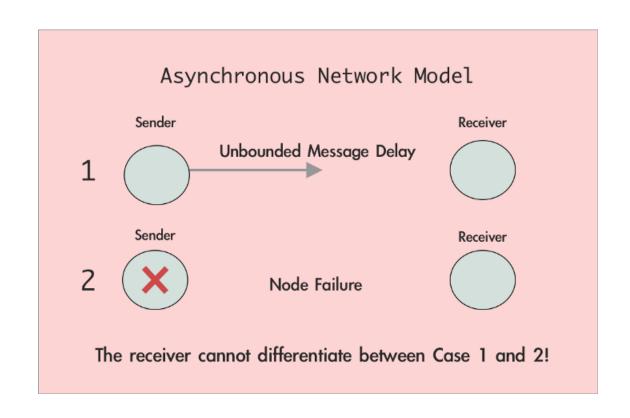

General Washington

PROPERTIES

- Asynchrony model

 networks can have unbounded delay
- Safety: all nodes agree on the state of the system
 - nothing bad should happen
- **Liveness**: progress is made on incoming requests
 - something good should happen
- Fault Tolerance: at least one node can fail

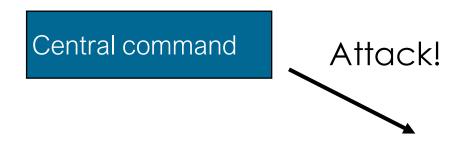

PROPERTIES

- Asynchrony: networks can have unbounded delay
- Safety: all nodes agree on the state of the system
 - nothing bad should happen
- Liveness: progress is made on incoming requests
 - something good should happen
- Fault Tolerance: at least one node can fail

FLP Impossibility Theorem: in an asynchronous network, you can only get 2 out of 3 properties

SLEEPY GENERALS PROBLEM

- Our general are tired, but messengers can't die!
- Need 2 generals to be awake and attack for success
 - If at most f generals can fall asleep at a time, how many general do we need?

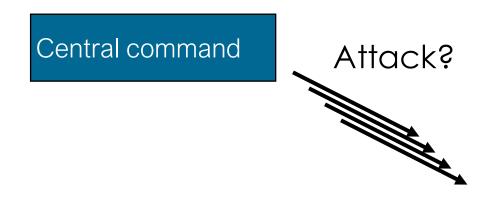

SLEEPY GENERALS PROBLEM

- Our general are tired, but messengers can't die!
- Need 2 generals to be awake and attack for success
 - If at most f generals can fall asleep at a time, how many general do we need?

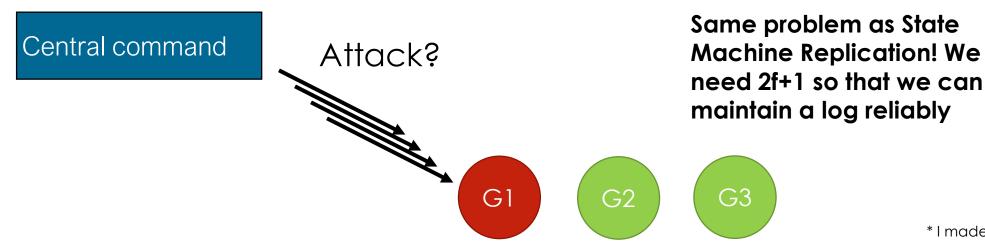

BUREAUCRATIC GENERALS PROBLEM*

- Our general are tired, but messengers can't die!
- Need 1 general to be awake and attack for success, f can fail
- Need to ensure that all paperwork is filled correctly!
 - Need complete history of commands to attack (stateful system)

BUREAUCRATIC GENERALS PROBLEM*

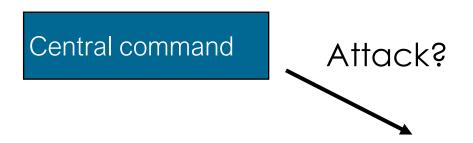

- Our general are tired, but messengers can't die!
- Need 1 general to be awake and attack for success, f can fail
- Need to ensure that all paperwork is filled correctly!
 - Need complete history of commands to attack (stateful system)

* I made up this name too

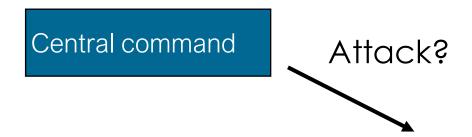

TRAITOROUS GENERALS PROBLEM

- One of our generals is a traitor!
- How to make majority of generals agree to attack?

TRAITOROUS GENERALS PROBLEM

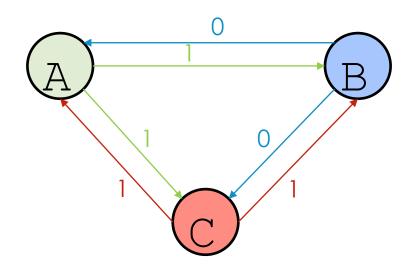

- One of our generals is a traitor!
- How to make majority of generals agree to attack?

Need more than f+1 replicas!
Can't have a trusted primary anymore!
Replicas need to talk to each other to
reach agreement on the decision
Vote and take the majority?

REACHING AGREEMENT

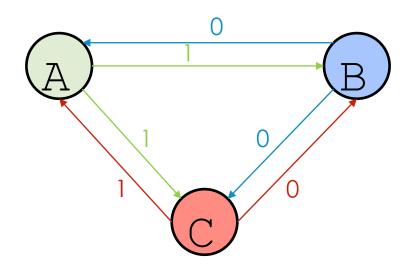

- The assault will only succeed if at least 2 armies attack at the same time
 - I vote we should... 1 = attack, 0 = retreat!

Replica	Receives	Action
A: 1	1-0-1	1
B: 0	1-0-1	1
C: 1	1-0-1	1

REACHING AGREEMENT

- The assault will only succeed if at least 2 armies attack at the same time
 - I vote we should... 1 = attack, 0 = retreat!

Replica	Receives	Action
A: 1	1-0-1	1
B: 0	1-0-0	0
C: śśś	1-0-?	0

BYZANTINE FAULT

- Is a condition of a computer system, particularly distributed computing systems, where components may fail and there is imperfect information on whether a component has failed
- Further, a component can fail in a malicious way, i.e., at the worst possible time and in the worst possible way
- Related terms: interactive consistency, source congruency, error avalanche, Byzantine agreement problem, Byzantine generals problem, and Byzantine failure

BYZANTINE GENERALS PROBLEM

There are multiple generals and multiple armies. Success can only be achieved if at least half of them attack at exactly the same time. If they fail to coordinate the timing of the attack, they will be defeated and lose the battle for sure.

They can only communicate with the other generals via their messenger. Moreover, they have Unfortunately, they have no way to check the authenticity of the message that they receive from the messenger.

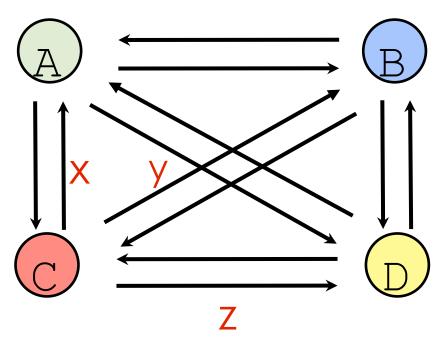

So how could an agreement be achieved in this circumstance?

That's your Byzantine Generals' Problem.

BYZANTINE GENERALS SOLVED*!

- Need more replicas to reach consensus
- Requires 3f+1 replicas to tolerate f byzantine faults
- Step 1: Send your plan to everyone
- Step 2: Send learned plans to everyone
- Step 3: Detect conflicts and use majority

Replica	Receives	Majority
A	B: $(1,0,0,1)$ C: $(1,1,1,1)$	A: 1 B: 1 C: 1 D: 1
В	B: $(1,0,\overline{0},1)$	A: 1 B: 1 C: 0 D: 1

PROBLEM SUMMARY

- Two Generals Problem
 - If network can arbitrarily lose messages, then it is impossible to guarantee two (or more) nodes can reach agreement
- Sleepy Generals Problem
 - If **f** nodes can fail, you need _____ replicas to guarantee **x** correct responses from a **stateless** system (typically x=1)
- Bureaucratic Generals Problem
 - If f nodes can fail, you need _____ replicas to guarantee a correct response from a stateful system
- Byzantine Generals Problem
 - If **f** nodes can be arbitrarily malicious, you need _____ replicas to guarantee a correct response (stateful or stateless)

PROBLEM SUMMARY

- Two Generals Problem
 - If network can arbitrarily lose messages, then it is impossible to guarantee two (or more) nodes can reach agreement
- Sleepy Generals Problem
 - If f nodes can fail, you need f+x replicas to guarantee x correct responses from a **stateless** system (typically x=1)
- Bureaucratic Generals Problem
 - ureaucratic Generals Problem Paxos, Raft

 If **f** nodes can fail, you need **2f+1** replicas to guarantee a correct response from a **stateful** system
- Byzantine Generals Problem
 - If f nodes can be arbitrarily malicious, you need 3f+1 replicas to guarantee a correct response (stateful or stateless)

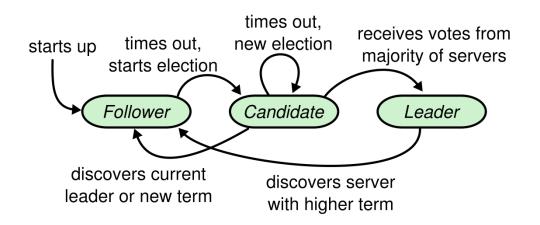

PAXOS AND RAFT

- Goal: Achieve state machine replication for crash fault tolerance (non-byzantine, stateful, reliable network)
- Paxos: Lamport '90, published '98 (interesting history)
 - Consensus algorithm presented in a paper pretending to describe how a fictitious ancient greek civilization wrote laws
 - Used by Google Chubby, Apache Zookeeper, etc.
- Raft: Ongaro and Ousterhout '14
 - An "Understandable Consensus Algorithm". Described as a set of Remote Procedure Calls (RPCs) that need to be implemented, but still provides strong guarantees
 - Dozens of implementations, used in many real products
- Both provide fault tolerance and safety, but are not guaranteed to terminate (no liveness)

RAFT – KEY IDEAS FOR SMR

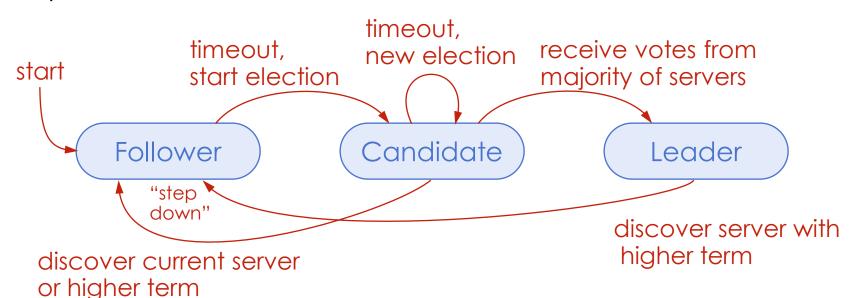

- Leader election: Elections periodically occur in case the primary fails
- Terms: Help track avoid inconsistent state after recovery
- Ordered Logs: All incoming requests pass through leader to be ordered

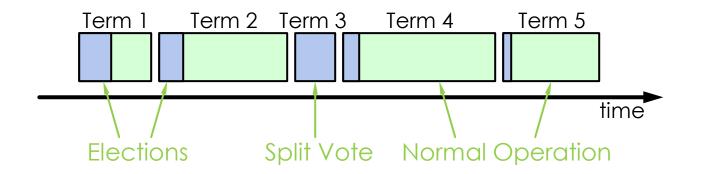

SERVER STATES

- At any given time, each server is either:
 - **Leader**: handles all client interactions, log replication, sends heartbeats
 - At most 1 viable leader at a time
 - Follower: completely passive (issues no RPCs, responds to incoming RPCs)
 - Candidate: used to elect a new leader
- Normal operation: 1 leader, N-1 followers

TERMS

- Time divided into terms:
 - Election
 - Normal operation under a single leader
- At most 1 leader per term
- Some terms have no leader (failed election)
- Each server maintains current term value
- Key role of terms: identify obsolete information

Raft Protocol Summary

Followers

- · Respond to RPCs from candidates and leaders.
- Convert to candidate if election timeout elapses without either:
- · Receiving valid AppendEntries RPC, or
- · Granting vote to candidate

Candidates

- · Increment currentTerm, vote for self
- · Reset election timeout
- Send RequestVote RPCs to all other servers, wait for either:
- Votes received from majority of servers: become leader
- AppendEntries RPC received from new leader: step down
- Election timeout elapses without election resolution: increment term, start new election
- Discover higher term: step down

Leaders

- Initialize nextIndex for each to last log index + 1
- Send initial empty AppendEntries RPCs (heartbeat) to each follower; repeat during idle periods to prevent election timeouts
- Accept commands from clients, append new entries to local log
- Whenever last log index ≥ nextIndex for a follower, send AppendEntries RPC with log entries starting at nextIndex, update nextIndex if successful
- If AppendEntries fails because of log inconsistency, decrement nextIndex and retry
- Mark log entries committed if stored on a majority of servers and at least one entry from current term is stored on a majority of servers
- Step down if currentTerm changes

RequestVote RPC

Invoked by candidates to gather votes.

Arguments:

candidateId candidate requesting vote term candidate's term

 lastLogIndex
 index of candidate's last log entry

 lastLogTerm
 term of candidate's last log entry

Results:

term currentTerm, for candidate to update itself voteGranted true means candidate received vote

Implementation:

- If term > currentTerm, currentTerm ← term (step down if leader or candidate)
- If term == currentTerm, votedFor is null or candidateId, and candidate's log is at least as complete as local log, grant vote and reset election timeout

Persistent State

Each server persists the following to stable storage synchronously before responding to RPCs:

currentTerm latest term server has seen (initialized to 0

on first boot)

votedFor candidateId that received vote in current

term (or null if none)

log[] log entries

Log Entry

term term when entry was received by leader

index position of entry in the log command command for state machine

AppendEntries RPC

Invoked by leader to replicate log entries and discover inconsistencies; also used as heartbeat.

Arguments:

term leader's term

leaderId so follower can redirect clients

new ones

prevLogTerm term of prevLogIndex entry

entries[] log entries to store (empty for heartbeat) last entry known to be committed

Results:

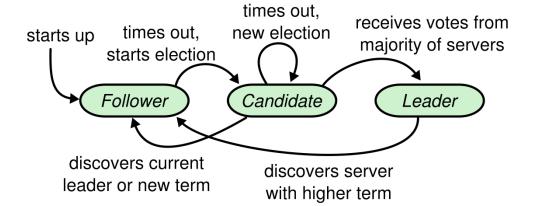

term currentTerm, for leader to update itself
success true if follower contained entry matching
prevLogIndex and prevLogTerm

Implementation:

- 1. Return if term < currentTerm
- 2. If term > currentTerm, currentTerm ← term
- 3. If candidate or leader, step down
- 4. Reset election timeout
- 5. Return failure if log doesn't contain an entry at prevLogIndex whose term matches prevLogTerm
- 6. If existing entries conflict with new entries, delete all existing entries starting with first conflicting entry
- 7. Append any new entries not already in the log
- 8. Advance state machine with newly committed entries

ELECTION BASICS

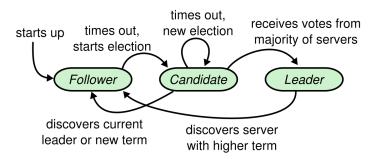

- Increment current term
- Change to Candidate state
- Vote for self
- Send RequestVote RPCs to all other servers, retry until either:
 - 1. Receive votes from majority of servers:
 - Become leader
 - Send AppendEntries heartbeats to all other servers
 - 2. Receive RPC from valid leader:
 - Return to follower state
 - 3. No-one wins election (election timeout elapses):
 - Increment term, start new election

LET'S RUN AN ELECTION!

Leader:

 Sends < Hello X > as heartbeat for term X every 5 seconds

Followers:

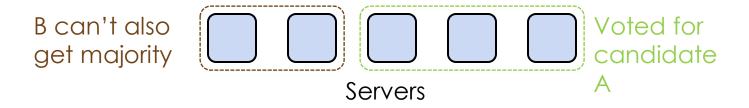

- If no heartbeat in 10 seconds, become a Candidate
- If Receive < Elect ID TERM>
 - Reply **VOTE ID>** to first candidate you hear
 - Wait 10 seconds, if no winner, become
 Candidate

Candidate:

- Send <Elect ID>
 - ID is my ID
- Send **<VOTE ID>** to vote for yourself
- Wait for VOTE messages
 - If got majority then send<WIN ID>
 - If no winner, wait 5-10 seconds and become
 Candidate

ELECTIONS, CONT'D

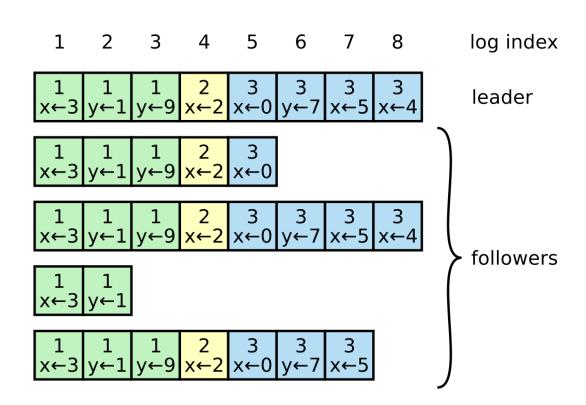

- Safety: allow at most one winner per term
 - Each server gives out only one vote per term (persist on disk)
 - Two different candidates can't accumulate majorities in same term

- Liveness: some candidate should eventually win
 - Choose election timeouts randomly in [T, 2T]
 - One server usually times out and wins election before others wake up
 - Works well if T >> broadcast time but not guaranteed!

LOG STRUCTURE

- Logs: Store a change to the system state, a term number and a log index.
- A log is committed by the leader once a majority of the nodes in the system have stored a copy of the entry.
- Recovery and changes: Failed nodes or newly joining nodes can be brought up to date by synchronizing log

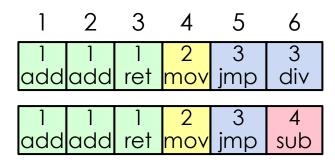

NORMAL OPERATION

- Client sends command to leader
- Leader appends command to its log
- Leader sends AppendEntries RPCs to followers
- Once new entry committed:
 - Leader passes command to its state machine, returns result to client
 - Leader notifies followers of committed entries in subsequent AppendEntries RPCs
 - Followers pass committed commands to their state machines
- Crashed/slow followers?
 - Leader retries RPCs until they succeed
- Performance is optimal in common case:
 - One successful RPC to any majority of servers

LOG CONSISTENCY

High level of coherency between logs:

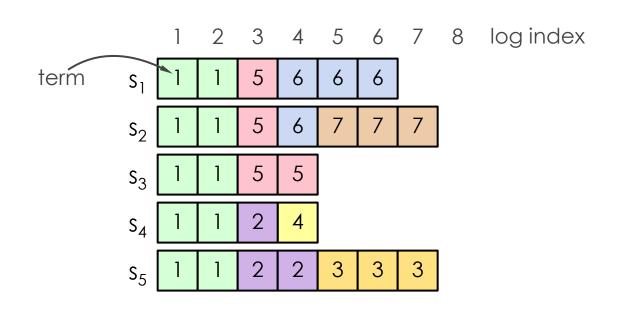

- If log entries on different servers have same index and term:
 - They store the same command
 - The logs are identical in all preceding entries

 If a given entry is committed, all preceding entries are also committed

ROLLBACK

- A failed leader may cause some nodes to have uncommitted logs
- When new electing a new leader, pick the one with the largest log!
- Roll back logs that weren't committed
- Logs can get into strange states if nodes fail/reconnect
- But if a majority of nodes hold a log we can treat it as committed and it will never be rolled back

RAFT SUMMARY

- 1. Leader election: uses randomness to resolve quickly
- 2. Normal operation: Leader orders requests, commit with majority
- 3. Safety and consistency: Client only gets response if committed
- 4. Rollback: Uncommitted logs can be removed if a leader fails

Guarantees consistent responses to client and no loss of state using **2f+1** nodes

Used by consistent data stores like etcd

Ph.D. of computational Intelligence

Many Objective Optimization, Distributed System, Green Energy, Blockchain

Co-chair and co-founder of the https://neoresearch.io, a place for scientific contributions for the Neo Ecosystem. Co-founder of the portal https://creating.city, an environment for academic and industrial discussions surrounding the cities of the future. One of the idealizes of the Grupo da Causa Humana.

During the PhD, Vitor did an exchange period at the University of Sheffield (England), in partnership with the Rolls Royce Technology Center in Control and Systems Engineering, and at ORT Braude College of Engineering (Israel), as a Marie Curie researcher for the European Commission as part of the Seventh Framework Program (FP7). Thesis awarded as the best one in the Engineering area in the year of 2016 of UFMG.
